

22. Construct a C program to implement best fit algorithm of memory management.

Code:

```
main.c ⌵ 🌙 🔗 Share Run

1  #include <stdio.h>
2
3  int main() {
4      int block[] = {100, 500, 200, 300};
5      int process = 150;
6      int i, pos = -1, best = 1000;
7
8      printf("Memory Blocks: 100 500 200 300\n");
9      printf("Process Size: %d\n", process);
10
11     for(i = 0; i < 4; i++) {
12         if(block[i] >= process && block[i] < best) {
13             best = block[i];
14             pos = i;
15         }
16     }
17
18     if(pos != -1)
19         printf("Process Allocated to Block %d\n", pos + 1);
20     else
21         printf("Memory Not Allocated\n");
22
23     return 0;
24 }
```

Output:

```
Output

Memory Blocks: 100 500 200 300
Process Size: 150
Process Allocated to Block 3
